

DUNCAN STUART TODD

**A NEW APPROACH
FOR LOCALIZED AIR EXTRACTION**

PrepArm for “Capture at Source” Air Extraction

Duncan Stuart Todd, Ltd. is proud to introduce the PrepArm, a new approach for extracting fumes at the source in preparation rooms.

PrepArm represents state-of-the-art technology for localized air extraction based on extensive experience in creating solutions for safe and clean working environments.

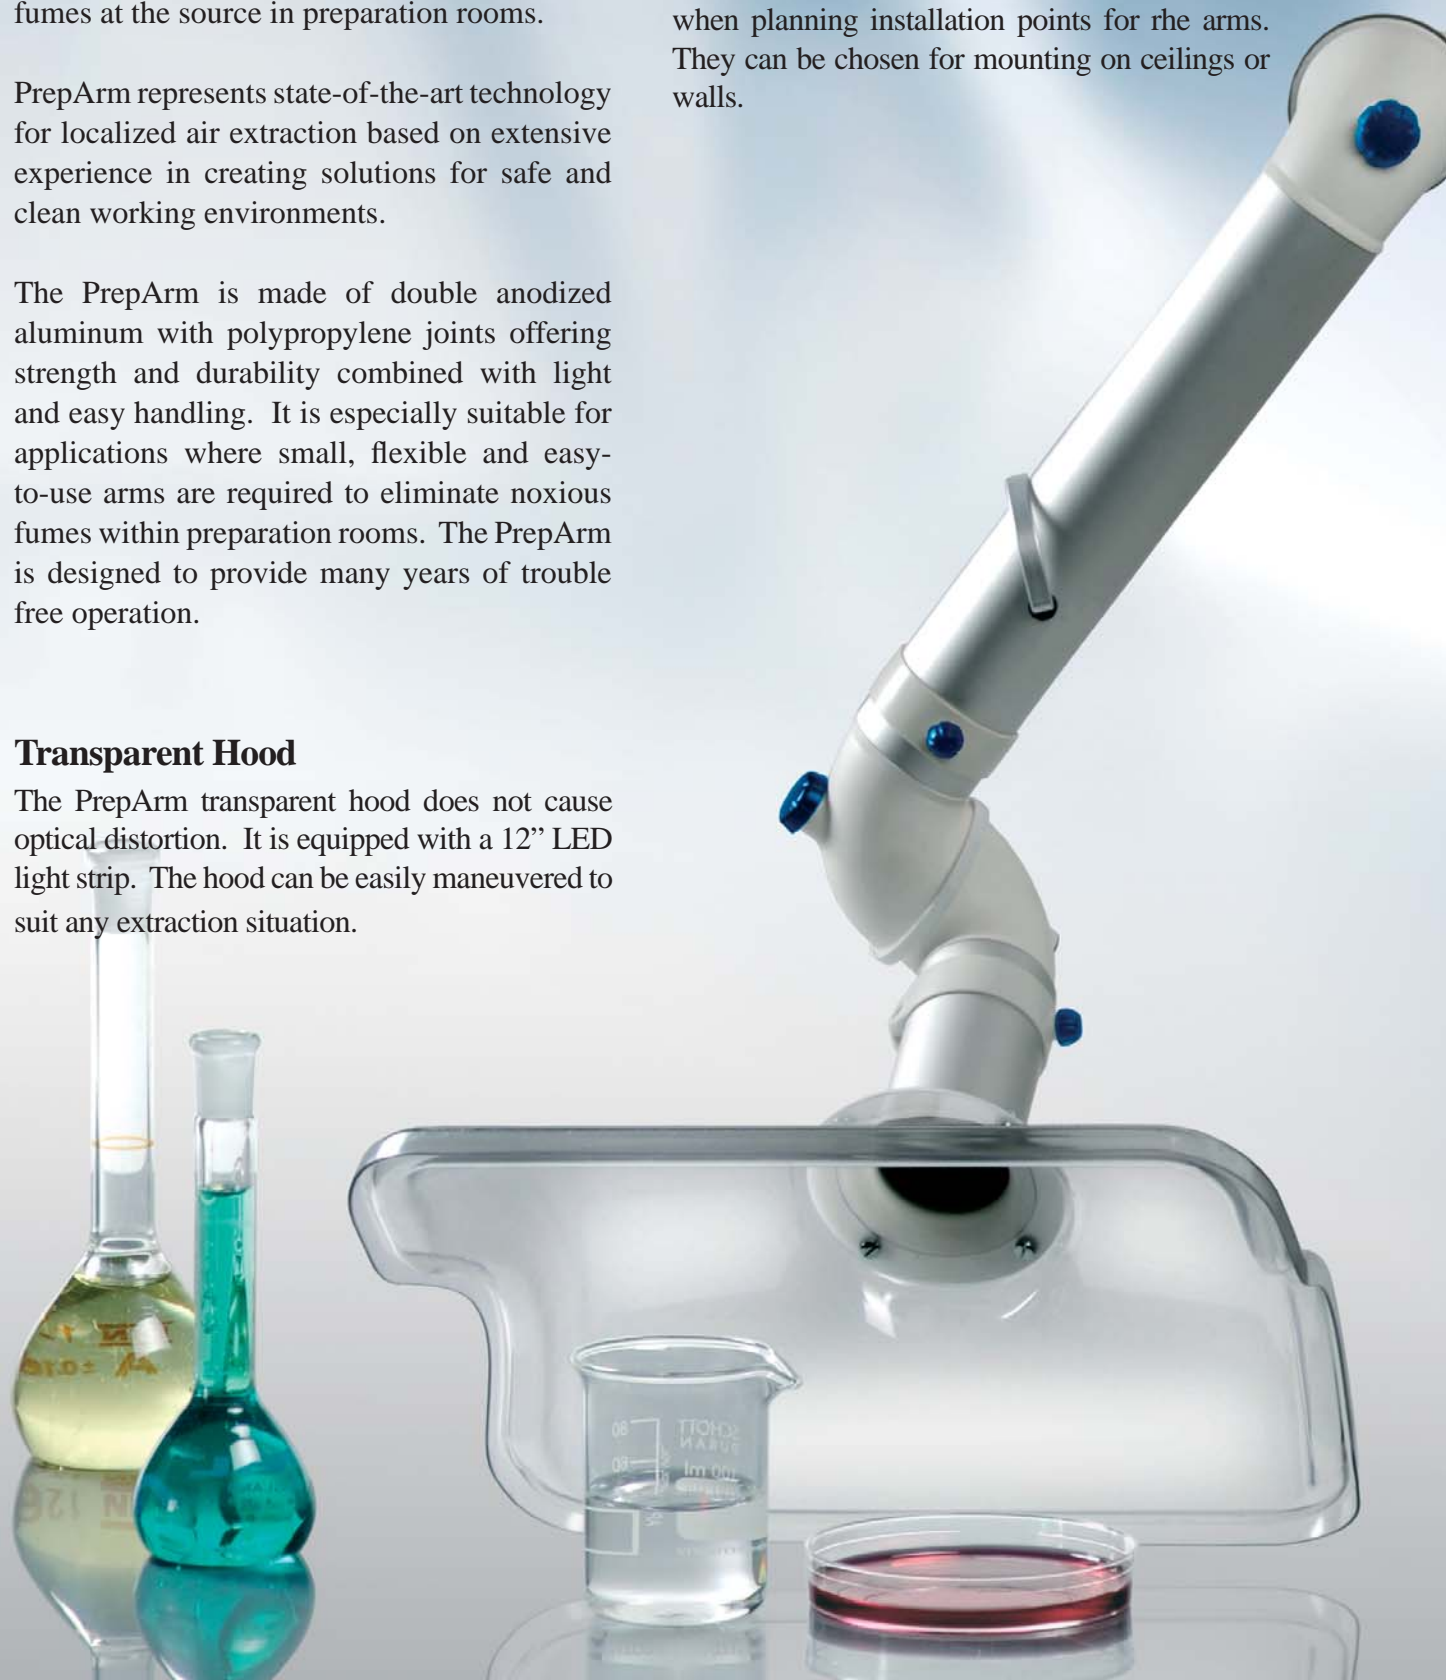

The PrepArm is made of double anodized aluminum with polypropylene joints offering strength and durability combined with light and easy handling. It is especially suitable for applications where small, flexible and easy-to-use arms are required to eliminate noxious fumes within preparation rooms. The PrepArm is designed to provide many years of trouble free operation.

Transparent Hood

The PrepArm transparent hood does not cause optical distortion. It is equipped with a 12” LED light strip. The hood can be easily maneuvered to suit any extraction situation.

Ceiling or Wall Mounting

The mounting bracket allows complete freedom when planning installation points for the arms. They can be chosen for mounting on ceilings or walls.

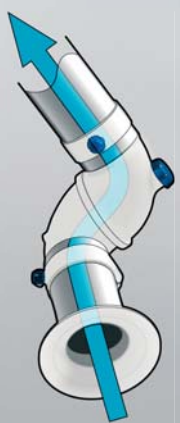

Unique Maneuverability

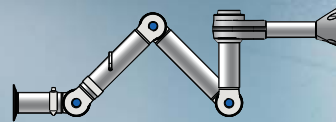

The two outermost joints in the arm can rotate and swivel through 360°. This provides unique directional flexibility and makes it possible to position the hood exactly where required. Once positioned, the hood can be locked in place using two friction devices in the arm joints.

Designed for Optimal Efficiency

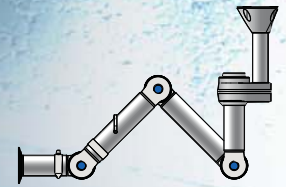

Computerized simulations were used in the development of this new series of extractors to create arms with optimal airflow and fume conveying characteristics. The improved airflow results in smaller, more efficient fans and reduced noise level.

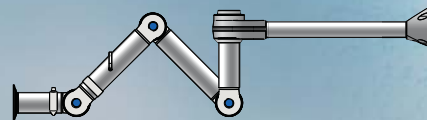

Mounting Options

*DST 104 - Wall mounting
Connection up*

*DST 106 - Ceiling mounting
Connection up*

The arm's reach can be increased by using an extension profile. Custom configurations are available. Carbon filtering solutions are also available.
